

Exception Handling -

while working on python we get two types of errors.

- 1) Syntax error
- 2) Exception (Runtime error)

Syntax error

```
for = 10X
```

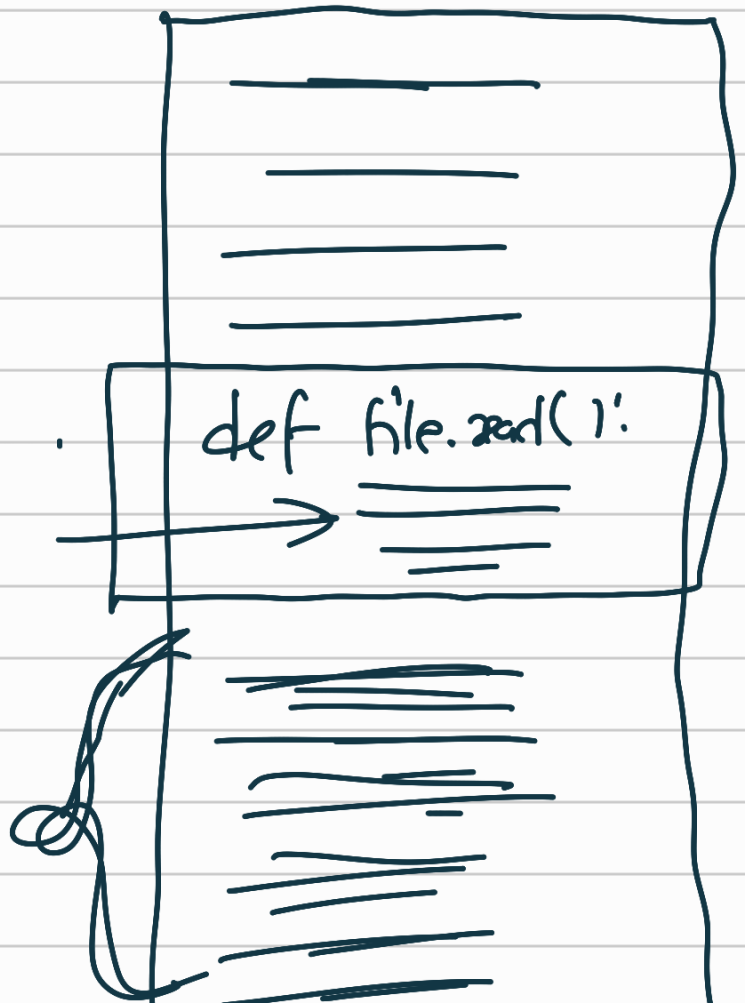

```
if x > 0X
```

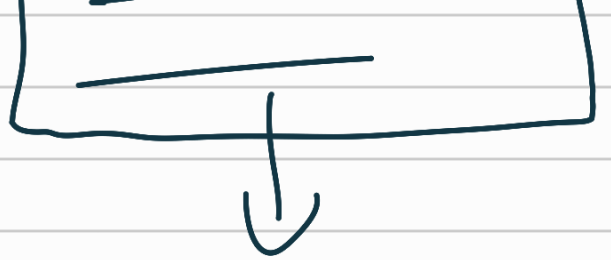

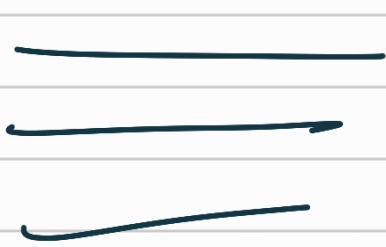

```
///
```

```
else:
```

```
///
```

1] Arithmetic errors ↴

① ZeroDivisionError — when
any number is divided by
zero.

exception handling syntax ↴

try :

← risky code
(exception/run
time error)

except :

— will catch that
exception in
except block

② Overflow error ↴

int $\rightarrow$ No limit

float $\rightarrow$ $1.8e^{308}$

overflow error raised when a floating point arithmetic result is too large to be represented.

2] Type & Value Error

① TypeError - TypeError raised when an operation is applied to an object of an inappropriate type.

int + int = int

$\begin{matrix} 1 & 1 \\ 10 & + & 20 \\ \hline \end{matrix} = 30$ ✓
int + int = int

"hello" + "world" = "helloworld"

"hello" + 10

str + int
